

Annuals & Perennials Info Sheet

Color is probably the single most powerful garden design factor. Annuals and perennials are the fastest, least expensive, most satisfying way to achieve quantities of garden color.

What Plant to Plant where? The value of design principles as they apply to color in the garden is a highly personal subject, and the garden is a forgiving place. Even mistakes can have merit. As a gardener, you should have the opportunity to discover for yourself what rules apply to your own garden and tastes. Colors can be divided into warm and cool colors. Colors yellow to red, are considered the warm colors. From green to violet are considered cool colors. Three major points to note on the use of cool and warm colors.

1) If you have a warm color house, by planting cool colors it will seem cooler and more inviting. This works in opposite to brighten up a house.

2) Remember cool colors tend to recede, and warm colors tend to advance. This means cool colors are good for close-up viewing and warm colors are good for dramatic displays. Using too many warm colors around cool color flowers can over power the cool colors thus losing the effectiveness of the cool color. However, placement of one slightly warmer (light yellow) color in a bed of cool colors (i.e. blues) can accentuate the cool colored plants.

3) Texture is another way to add interest. Use plants with upright or colorful foliage with "regular" or clumping plants to keep the eye moving or to catch the eye for emphasis. Use flowers that spike with drooping or groundcover type flowers.

In the garden you have four choices for color combinations.

1) **Monochromatic:** The use of the various tints and shades of pure colors. An example would be using red with various tints of pink, and a deep shade of red.

2) **Analogous:** This is the use of closely related colors. An example would be blue with blue/green and blue violet.

3) **Complimentary:** This is the use of complete opposites. This generally is a powerful combination. An example is red and green, orange and blue, yellow and violet, and so on.

4) **Polychromatic:** This is the carnival-like effect in the garden. The random coupling of any and every color. Which is correct for you is best decided by you.

When deciding on what plant, note how tall, how wide, what color, and what season. Most starter plants look about the same size when purchased. You would not want to plant tall growing plants in front of shorter ones. You also want to space the plants correctly to avoid overcrowding.

Prepare Soil: Mix [Rockledge Gardens Planting Mix](#) with existing soil. If planting in containers use a [light-weight soil](#) such as [Ferti-Lome's Ultimate Potting Mix](#) or [Happy Frog](#).

Fertilization: Use [Espoma Flower-Tone](#) every month or [Dynamite Fertilizer](#) every four months. For an extra push use [Neptune's Harvest Liquid Fish & Seaweed](#) or [Maxicrop Liquid Seaweed](#) every two weeks. Do not use weed 'n feeds near your plants!

Watering: Water area before planting. Immediately after planting, protect plants from excess rain and wind. Water plants in pots after transplanting. Never plant deeper than the original soil level. Watering is essential every 2-3 days for one month, but allow a day or two in between to allow oxygen access to the roots.

Problems: The most critical time is when the new plants are first planted. Don't overwater. Most pest problems can be controlled easily if detected in early stages. For most pests, use [Spinosad](#), [Natural Pyrethrins](#), [Neem](#) or [All Season Oil](#).

Annuals last for one season - Perennials return again and again.

Rockledge Gardens

Plant	A/P	Sun	Water	Salt Tol.	Height	Season	Colors
Ageratum	P	Sun/Shade	Med/hi	Low	12"-24"	all	Purple, white
